Abstracts

Sea-island microfiber polyester chips are polyester chips specifically designed for the production of sea-island microfibers. Sea-island microfibers are a special fiber structure composed of ultrafine fibers with diameters typically less than 1 micrometer. This fiber structure imparts extremely high specific surface area and excellent moisture absorption and breathability to sea-island microfibers. During production, the polyester chips are processed into sea-island composite fibers, which are then subjected to a process to dissolve the island component, resulting in ultrafine fibers. Sea-island microfibers have a wide range of applications in textiles, filtration materials, wiping materials, and other fields, and are favored by consumers for their soft and delicate hand feel and excellent wearability.

The global Sea-Island Microfiber Polyester Chips market size was estimated at USD 647.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
