Abstracts

A sealed gauge transducer is a pressure measurement device that senses and converts pressure relative to a fixed reference pressure (typically atmospheric pressure at sea level) into an electrical output signal, such as a voltage, current, or digital value; it is "sealed" because the reference side of the sensing element is enclosed in a vacuum or at a known atmospheric pressure, protecting the measurement from external barometric fluctuations and making it particularly suitable for applications where pressure must be measured relative to a stable, constant reference point rather than the ambient environment. These transducers are widely used in industries such as HVAC, hydraulics, process control, and automotive systems, where consistent and repeatable pressure readings are essential, and they differ from absolute or differential pressure transducers by their specific reference method, which isolates the measurement from changes in local atmospheric conditions.

The global Sealed Gauge Transducer market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
