Abstracts

Seamless Rolled Ring Forgings are circular metal components fabricated through a specialized forging process that begins with a solid cylindrical billet of metal. The billet is heated and then subjected to a sequence of operations like upsetting, piercing, and rolling, which transform it into a seamless ring shape. This process enables precise control over the ring's dimensions, internal and external geometries, and grain structure, resulting in a final product with high strength, excellent mechanical properties, and no weld seams, making them highly suitable for various applications in industries such as aerospace, automotive, power generation, and heavy machinery.

The global Seamless Rolled Ring Forgings market size was estimated at USD 11730.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
