Abstracts

Seawater source chillers are refrigeration equipment specially designed to use seawater as a cooling medium. They are widely used in large buildings, industrial facilities and marine engineering in coastal areas. The core components of this chiller include a compressor, a condenser, an evaporator and an expansion valve. During operation, the refrigerant is compressed into a high-temperature and high-pressure gas by the compressor, enters the condenser for heat exchange with seawater, and becomes liquid after releasing heat. Subsequently, the refrigerant is decompressed and cooled by the expansion valve, and absorbs heat from the load side (such as the air conditioning system or process flow) in the evaporator to complete the refrigeration cycle.

The global Seawater Source Chillers market size was estimated at USD 5988.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
