Abstracts

Seawater heat pumps are an energy-efficient HVAC (heating, ventilation and air conditioning) solution that uses the stable temperature of the ocean or large bodies of water to provide heating and cooling for buildings. The system exchanges heat with seawater through a heat exchanger installed in the seawater. In winter, the heat pump extracts heat from the seawater and transfers it to the building; in summer, it operates in reverse, transferring heat from the building to the seawater. Since seawater temperature is relatively stable and not affected by seasonal changes, seawater heat pumps can provide more stable performance. Suitable for residential, commercial and industrial buildings in coastal areas.

The global Seawater Source Heat Pump Units market size was estimated at USD 6054.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
