Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Secoisolariciresinol competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Open-ring isolarciphinol is a natural compound extracted from larch resin. Belonging to the phenolic class, it possesses significant antioxidant, anti-inflammatory, antibacterial, and antitumor bioactivities. It is widely used in pharmaceuticals, cosmetics, food, and agriculture, and has attracted considerable attention due to its ability to effectively neutralize free radicals, inhibit inflammatory responses, and kill pathogenic microorganisms. Furthermore, open-ring isolarciphinol also exhibits potential anticancer properties, making it an important direction in drug research and development. The open-ring isolarciphinol resin phenol industry chain mainly consists of natural resin raw materials ? chemical modification and processing ? downstream resin/adhesive/coating companies ? end applications: The upstream uses larch resin, rosin, and their deep-processed resin acids as raw materials, and is affected by forestry resources, seasonality, and resin tapping volume; the midstream produces isolarciphinol resin phenol through processes such as ring-opening, esterification, and hydrogenation modification, which has high technical barriers, strict equipment investment and reaction control requirements, and is the highest value link in the industry chain; the downstream is widely used in epoxy resin curing agents, phenolic resin modifiers, rubber adhesive accelerators, environmentally friendly adhesives, and functional coatings, covering industries such as electronic packaging, rail transportation, automobiles, and high-end structural adhesives. Overall, open-ring isolarciphinol resin phenol belongs to the category of "functional resin additives." The gross profit margin of midstream production is generally 25%-40%, while the gross profit margin of downstream resin/adhesive further processing is about 15%-25%, exhibiting

characteristics of "large fluctuations in raw material prices, higher profits in the modification stage, and intense competition in the end market." In 2024, the global production of open-ring isolarcitabine resin reached 567 grams, with an average selling price of US\$231 per milligram. Open-ring isolarcinol is a special class of phenolic compounds obtained by chemical modification of larch resin acids, possessing the dual characteristics of both natural resin origin and functionalized structure. Its "open-ring" structure endows the molecule with higher reactivity and better compatibility, allowing it to be used in modified resins, adhesives, coatings, rubber additives, and polymer materials to improve heat resistance, mechanical strength, and adhesion properties. The advantages of this product lie in its renewable source, controllable performance, and large potential for environmentally friendly substitution; however, industrial production is still limited by raw material fluctuations, high process complexity, and the maturity of downstream applications. Therefore, it has considerable development potential in the fields of green materials, high-performance resins, and novel functional additives.

The global Secoisolariciresinol market size was estimated at USD 131.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
