Second-generation antipsychotics, also known as atypical antipsychotics or novel antipsychotics. Compared with the first generation drugs, the second generation antipsychotic drugs have significant differences in pharmacological mechanisms, clinical efficacy, and side effect profiles, making them the mainstream choice for the treatment of severe mental disorders such as schizophrenia and bipolar disorder. From the perspective of pharmacological mechanisms, second-generation antipsychotics can be divided into four categories: 5-hydroxytryptamine and dopamine receptor antagonists (such as risperidone, olanzapine, quetiapine, and ziprasidone), multi receptor acting drugs (such as clozapine), selective dopamine receptor antagonists (such as amisulpride), and dopamine receptor partial agonists (such as aripiprazole).
