Abstracts

Military image intensifiers are electro-optical systems that increase the intensity of available light to achieve night vision. The core of the system is the complex conversion of energy particles in a vacuum tube: photons are collected by the objective lens, the photocathode converts them into electrons, the microchannel plate increases the electrical energy, and finally the fluorescent screen converts the electrical energy back into light and presents the image. This process enables clear images to be observed even in low light conditions and is widely used in the military field. At present, the market is mainly dominated by second and third generation image intensifiers.

The global Second and Third Generation Military Image Intensifier market size was estimated at USD 1225.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
