Report Overview

Secondary impact crushers are crushing machines designed to process middle-size stone products into gravel or sand-sized aggregate. Impact crushers differ from other crushing machines in that they utilise impact as the mechanism of crushing, rather than the pressure force employed by other kinds of crushers. Commonly found in a range of mining and construction settings, allowing operations to convert rubble and larger-size stone and mineral debris into useful, smaller-size aggregate, secondary impact crushers are perfect for industrial and construction purposes. Secondary impactors are widely accepted as the machine of choice as secondary reduction units for materials of medium to low silica contents such as limestone, dolomitic limestone, dolomite and gypsum. Large feed opening, cubical products, high reduction ratio, high capacity, low investment and operating costs are some of the features which make these crushers ideal as secondary crushers in complete crushing plants.
