Abstracts

Secondary ion mass spectrometry (SIMS) is a surface analysis technology based on mass spectrometry. It bombards the sample surface with a high-energy primary ion beam, causing atoms or atomic groups on the sample surface to absorb energy and sputter from the surface to produce secondary particles. These charged particles can be passed through the mass analyzer to obtain a spectrum of information about the sample surface. With the continuous development of science and technology and the increasing demand for high-precision and high-sensitivity analysis technology in various fields, the market size of secondary ion mass spectrometers is expanding. Especially in the fields of semiconductors, biomedicine, environmental sciences, etc., the application of secondary ion mass spectrometers is becoming more and more extensive, and the market demand continues to grow. As an advanced surface and subsurface analysis technology, secondary ion mass spectrometer plays an important role in modern scientific research and industrial production. Its high precision and high sensitivity make it have broad application prospects in many fields. With the continuous advancement of technology and the reduction of costs, it is believed that secondary ion mass spectrometers will demonstrate their application value in more fields.

The global Secondary Ion Mass Spectrometer market size was estimated at USD 1160.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.70% during the forecast period.
