## Abstracts

Secondary neutron source materials are materials used to maintain chain reactions in nuclear reactors. They maintain the fission process of nuclear fuel by absorbing primary neutrons produced in the reactor and then releasing secondary neutrons. Common secondary neutron source materials include californium-252, radium-beryllium (Ra-Be), plutonium-beryllium (Pu-Be), lithium-tritium (Li-T), cobalt-60, and metal compounds represented by antimony-beryllium (Sb-Be). These materials can produce secondary neutrons through specific nuclear reactions under the irradiation of primary neutrons, ensuring the stable operation of the reactor at low power or startup stages.

The global Secondary Neutron Source Materials market size was estimated at USD 127.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
