## Abstracts

Secure SSDs and hard drives are storage devices that have built-in security features, primarily hardware-level encryption, to protect data from unauthorized access. Unlike software encryption, which relies on the computer's CPU, these drives use a dedicated cryptographic chip on the drive itself. This approach not only provides robust security but also avoids any performance impact on the system. The drive is typically locked until the correct authentication key (like a password or fingerprint) is provided, ensuring that even if the drive is physically stolen, the data remains inaccessible to thieves. This makes them ideal for safeguarding sensitive information in laptops, servers, or any device that might be lost or compromised.

The global Secure SSDs and Hard Drives market size was estimated at USD 6402.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
