Abstracts

Sedation in the ICU setting refers to the controlled administration of pharmacological agents to critically ill patients to induce a state of calm, reduce anxiety, alleviate pain, facilitate mechanical ventilation, prevent self-extubation or device removal, and minimize oxygen consumption, with the goal of optimizing patient comfort and safety while supporting recovery; it involves a delicate balance between achieving adequate sedation?often assessed through validated scales such as the Richmond Agitation-Sedation Scale (RASS) or Sedation-Agitation Scale (SAS)?and avoiding oversedation, which can lead to prolonged mechanical ventilation, increased risk of delirium, longer ICU stays, and higher healthcare costs. The approach has evolved significantly toward lighter, more titratable sedation strategies using agents like dexmedetomidine, propofol, or benzodiazepines, often integrated into protocol-driven, nurse-managed sedation practices and daily sedation interruption or spontaneous awakening trials to improve outcomes.

The global Sedation In Icu Setting market size was estimated at USD 3200.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
