Report Overview:

A sedimenting centrifuge is a type of centrifuge that is used to separate solid particles from a liquid mixture based on their density. It works by spinning the mixture at a high speed, causing the denser particles to settle at the bottom of the centrifuge tube while the lighter particles remain suspended in the liquid. This process is known as sedimentation. The separated solids can then be collected and the liquid can be decanted or further processed. Sedimenting centrifuges are commonly used in various industries such as wastewater treatment, oil and gas, pharmaceuticals, and food processing.
