Abstracts

The ability of radar systems for through-the-wall surveillance to detect movement through walls is dependent upon how well the radio waves penetrate the wall. The material and thickness of the wall impact the ability of the system to acquire a reading; the radio waves cannot penetrate steel, and extremely thick barriers may block the radio waves or delay the time it takes to acquire a reading. In addition, interference may occur when simultaneously using multiple systems or other devices that operate within the same radio frequency range.

The global See Through Wall Radar System market size was estimated at USD 116.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
