Report Overview

Seed treatment nematicides are insecticides that are used to treat seeds to prevent and control nematode behavior in seeds. These nematicides usually contain specific chemical components that effectively inhibit the growth and proliferation of nematodes, thereby protecting seeds and seedlings. Seed treatment nematicides are usually applied to the surface or interior of the seed in the form of drenches, washes or sprays to ensure that they are effective in controlling nematodes after the crop. These nematicides avoid or minimize the damage caused by nematodes to seeds and seedlings and improve crop yield and quality.
