Report Overview

Seedbed cultivators are equipment designed for minimum tillage to shred and refine the soil. These machines are made up of a large number of operating elements that prepare the seed bed; their combination, together with the remarkable working speeds allows the achievement of an optimal fragmentation of the clods with exceptional results in the presence of any terrain. Cultivators stir and pulverize the soil, either before planting (to aerate the soil and prepare a smooth, loose seedbed) or after the crop has begun growing (to kill weeds—controlled disturbance of the topsoil close to the crop plants kills the surrounding weeds by uprooting them, burying their leaves to disrupt their photosynthesis or a combination of both). Unlike a harrow, which disturbs the entire surface of the soil, cultivators are designed to disturb the soil in careful patterns, sparing the crop plants but disrupting the weeds.
