Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Seeded Gel Abrasive competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Seeded gel abrasive is an advanced material made by embedding ultrafine alumina or zirconia seed crystals into a sol-gel alumina matrix, producing a fine-grained structure with high toughness, self-sharpening ability, and long grinding life. Its supply chain starts with bauxite and zircon sand, processed into sols and transformed through sol-gel methods into abrasive grains, which are then used in wheels, belts, and discs for aerospace, automotive, metal fabrication, and engineering applications. The global industry produces about 360,000 tons annually with a capacity of 480,000 tons, achieving an average 32% gross margin and unit prices of USD 3,200-7,800 per ton depending on grit size, bonding, and form.
