Report Overview:

Seismic Dampers are used in damping the oscillations of a building during an earthquake. There are many types of dampers for buildings, and damping through friction tends to be one of the most efficient methods of dissipating seismic energy. The friction damper operates by dissipating kinetic energy through friction. The Dampers allow the building to move elastically and dissipate the energy of the earthquake. This, in turn, produces substantial savings as structural elements can be optimized for cost savings.

The Global Seismic Dampers in Buildings Market Size was estimated at USD 1603.39 million in 2023 and is projected to reach USD 2005.50 million by 2029, exhibiting a CAGR of 3.80% during the forecast period.
