Abstracts

Seismic elastomeric face seal system is a type of sealing arrangement used in construction or infrastructure projects to accommodate movement or vibration induced by seismic activities. It typically consists of elastomeric materials, such as rubber or synthetic compounds, strategically placed between two structural elements to provide flexibility and absorb seismic forces. This system helps reduce the transmission of vibrations and minimizes the potential for damage or failure in structures during earthquakes or other seismic events. The elastomeric face seal acts as a buffer, allowing controlled movement and absorbing energy to protect the integrity of the structure.

The global Seismic Elastomeric Face Seal System market size was estimated at USD 280.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
