Abstracts

The seismic structural support system is to prevent the displacement of the facility, the core purpose of seismic bracing is to restrict horizontal shaking from an earthquake. All seismic braces firmly attach equipment to structural members of a building so that they move with the structure during an earthquake. Increasing awareness about potential risks and consequences of earthquakes will drive the market, with greater emphasis placed on investing in technologies that can mitigate these risks. Governments, organizations and individuals are recognizing the importance of earthquake protection to protect life and reduce property damage. Rapid urbanization, especially in earthquake-prone regions, will drive the demand for earthquake protection devices. The construction of tall buildings, bridges, dams and other critical infrastructure requires advanced technologies to ensure their resilience against seismic events. Government and industry bodies are enforcing stricter building codes and regulations, especially in earthquake-prone regions. Increasing investments in infrastructure projects in both developed and developing countries will aid economic growth, and these codes often require the implementation of seismic protection measures, thereby driving the demand for equipment that complies with these codes.

The global Seismic Structural Support Systems market size was estimated at USD 810.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
