## Abstracts

Powder-spreading metal 3D printing is an important branch of metal additive manufacturing technology. This technology uses metal powder pre-placed on a powder platform as raw material, based on the three-dimensional digital model of the part, and uses high-energy beams such as lasers or electron beams to melt the powder layer by layer on a series of two-dimensional planes discrete from the three-dimensional model, and finally manufacture three-dimensional metal parts. Currently, the most widely used is powder-spreading metal 3D printing that uses laser as an energy source, also known as Selective Laser Melting (SLM).

The global Selected Laser Melting Printer market size was estimated at USD 714.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 17.20% during the forecast period.
