Abstracts

Selective Cox-2 inhibitors are a class of nonsteroidal anti-inflammatory drugs (NSAIDs) that specifically target the cyclooxygenase-2 (COX-2) enzyme, which is primarily responsible for inflammation and pain, while sparing the COX-1 enzyme that helps protect the stomach lining and supports platelet function. These drugs, such as celecoxib, were developed to reduce the gastrointestinal side effects?such as ulcers and bleeding?commonly associated with traditional NSAIDs like ibuprofen or naproxen, which inhibit both COX-1 and COX-2 enzymes. By offering analgesic and anti-inflammatory benefits with an improved safety profile for the digestive system, selective COX-2 inhibitors are particularly indicated for patients with arthritis and chronic pain conditions who are at risk for GI complications, though their use is carefully managed due to cardiovascular risks identified in some medications within this class.

The global Selective Cox 2 Inhibitors market size was estimated at USD 7100.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
