Abstracts

Self-baking electrodes, also known as Soderberg electrodes, are a type of continuously consumable electrode used primarily in submerged arc furnaces for the production of ferroalloys, silicon metal, calcium carbide, and other industrial materials, where they serve as both conductors of electrical energy and sources of carbon for chemical reduction processes. These electrodes consist of a steel casing filled with a paste composed of calcined anthracite, coal tar pitch, and other carbonaceous materials, which bakes in situ from the heat generated by the furnace itself, eliminating the need for external baking and allowing for uninterrupted operation as the electrode is consumed and replenished from above.

The global Self Baking Electrodes market size was estimated at USD 2500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
