Abstracts

Self-charging pacemakers, also known as energy harvesting or self-powered pacemakers, are advanced cardiac implantable electronic devices designed to eliminate the need for battery replacement surgeries by converting kinetic energy from the patient's body?such as heart motion, breathing, or blood flow?into electrical energy to continuously recharge the device's internal battery. These devices integrate energy harvesting technologies, such as piezoelectric materials, electromagnetic induction, or triboelectric nanogenerators, which capture and convert mechanical energy from natural physiological movements into usable power, significantly extending the device?s operational lifespan and reducing the risks and costs associated with surgical interventions.
