Abstracts

The working principle of the self-cleaning centrifuge is to use the centrifugal force generated by rotation to separate different substances in the mixture according to their density and mass differences. Under the action of centrifugal force, heavier substances will be pushed to the outer wall of the centrifuge, while lighter substances will remain inside or in the center, thereby achieving the separation of substances. Compared with traditional centrifuges, self-cleaning centrifuges have the function of automatic cleaning, do not need to manually clean the centrifugal drum, and are more convenient to operate. Self-cleaning centrifuges can achieve efficient and fast separation operations and improve production efficiency.

The global Self-cleaning Centrifuge market size was estimated at USD 3446.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
