Report Overview

Self-cleaning glass is a specific type of glass with a surface that keeps itself free of dirt and grime.

The field of self-cleaning coatings on glass is divided into two categories: hydrophobic and hydrophilic. These two types of coating both clean themselves through the action of water, the former by rolling droplets and the latter by sheeting water that carries away dirt. Hydrophilic coatings based on titania (titanium dioxide), however, have an additional property: they can chemically break down absorbed dirt in sunlight.

The Asia Pacific is expected to be the fastest-growing market for self-cleaning glass during the forecast period. The growing middle-class populations with high disposable incomes and increasing demand for sustainable construction are major factors contributing to the growth of the self-cleaning glass market in this region.
