Abstracts

A self-contained steam biological indicator is a tool used to verify the effectiveness of a steam sterilization process. It encapsulates highly heat-resistant bacterial spores and culture medium in a single unit. When used, these indicators are placed in a steam sterilizer, subjected to a certain steam treatment, and then removed for incubation. If the sterilization process is effective, the spores will be killed and no more growth will occur in the culture medium. If the sterilization process fails, the spores survive and grow, indicating that the sterilization process did not achieve the desired effect.

The global Self-Contained Biological Indicators for Steam market size was estimated at USD 292.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
