Report Overview

A self elevating gearbox is a gearbox used on offshore drilling platforms, allowing the drilling platform to lift itself above the waterline. The transmission is mounted on a series of hydraulic cylinders that can raise or lower the platform as needed. Self-elevating gearboxes are typically located on the legs of a drilling rig to control the angle of the platform. By adjusting the angle of the platform, the automatic lifting gearbox allows the platform to rise and fall in the water. This is important for offshore drilling operations because it allows the platform to remain stable under adverse sea conditions and allows drilling to proceed in deeper waters. Self elevating gearboxes are typically driven by diesel engines or electric motors to provide the power required for lifting platforms. The gearbox itself is designed to be robust and durable because it must withstand the extreme forces and loads associated with offshore drilling operations.
