### Report Overview

Self-healing capacitors use a single-layer polypropylene film as a medium, and a thin layer of metal is evaporated on the surface as a conductive electrode. When an excessively high voltage is applied, the electrical weak point of the polypropylene film is broken down, the impedance of the breakdown point is significantly reduced, and the current density flowing through it increases sharply, which makes the metallized coating generate high heat, and the metal conductor around the breakdown point evaporates and escapes rapidly. Dispersion, forming a blank area of metal plating, the breakdown point automatically restores insulation.
