## Abstracts

Self-healing concrete is a special type of concrete that can repair itself after damage has occurred. The ability of concrete to repair itself when cracks appear is known as its self-healing or self-repairing properties. The durability of concrete is a defining characteristic for these uses. The durable material properties of concrete enhance its resistance to physical and chemical attack. There is a correlation between a decrease in durability and an increase in the likelihood of cracking. The self-healing concrete market is a rapidly evolving segment of the construction industry, driven by innovations in material science, sustainability initiatives, and the growing need for more durable, long-lasting infrastructure. Self-healing concrete is designed to automatically repair cracks and damages that might occur over time, enhancing the lifespan and reducing the maintenance costs of concrete structures. With a rising emphasis on sustainable construction practices, self-healing concrete offers a major advantage by extending the life of structures and reducing the need for repairs or replacements. This aligns with global sustainability goals, reducing waste and resource consumption. Self-healing concrete is seen as a cost-effective solution in the long run due to the reduction in maintenance and repair needs. This makes it increasingly attractive for both public and private sector construction projects. One of the key innovations is the use of bacteria (such as *Bacillus* species) embedded within the concrete. These bacteria remain dormant until cracks form, at which point they activate and produce calcium carbonate to seal the cracks. This type of bio-based self-healing is gaining traction due to its eco-friendliness and natural processes. Another approach is the use of microcapsules or vascular systems that release healing agents (like epoxy or other polymers) when cracks appear. The release of these agents fills the cracks and restores the integrity of the concrete. Incorporating polymers within the concrete mix that can flow and fill cracks when activated is an emerging trend, especially in highly durable or specialized concrete types.

The global Self Healing Concrete (SHC) market size was estimated at USD 99.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.50% during the forecast period.
