Abstracts

Self-healing elastomers represent a class of synthetic polymers that possess the intrinsic ability to autonomously repair physical damage, such as cuts, scratches, or mechanical fatigue, without external intervention, primarily through mechanisms like reversible covalent bonding, hydrogen bonding, ionic rearrangement, or microencapsulated healing agents that are released upon rupture; these materials are engineered to restore their structural integrity, mechanical properties, and functional performance after damage, mimicking biological systems such as skin healing, and are characterized by their elasticity, durability, and responsiveness to stimuli like heat, light, or pressure, making them distinct from conventional elastomers which lack such regenerative capabilities.

The global Self Healing Elastomers market size was estimated at USD 385.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
