Abstracts

Self-locking barbed sutures are a type of surgical suture designed with tiny barbs along the thread that lock into tissue, eliminating the need for traditional knot-tying. These barbs grip tissue in place as the suture is threaded through, providing secure wound closure and evenly distributing tension. By reducing knot-related complications and saving time, self-locking barbed sutures are especially useful in minimally invasive and complex surgeries, such as those in plastic, orthopedic, and gynecological procedures.

The global Self-Locking Barbed Sutures market size was estimated at USD 540.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
