Report Overview:

Self-lubricating bearings, as the name suggests, provide their own lubrication during operation without requiring application of grease or oil lubricants. As the bearing operates, the lubricant is released through pores in the sliding layer, lubricating the bearing surface. The lubricant is uniformly dispersed throughout the sliding layer and thus there is no reduction in low friction bearing performance, even if the sliding layer becomes worn. A “running-in” surface is also usually included at the top of the sliding layer to provide low friction bearing performance at start up before the impregnated lubricant reaches the bearing surface.

The Global Self-lubricating Bearings Market Size was estimated at USD 5412.30 million in 2023 and is projected to reach USD 7253.00 million by 2029, exhibiting a CAGR of 5.00% during the forecast period.
