#### Report Overview:

Self-lubrication is characterized by the bearings ability to transfer microscopic amounts of material to the mating surface. This transfer process creates a film that provides lubrication and reduces friction over the length of the rail or shaft. Self-lubrication has several advantages over traditional lubricated bearings. Self-lubricating bearings save time and money on preventative maintenance, and require no hazardous waste from the lubricant, disposal, or cleanup to handle. Self-lubrication ensures frictional forces on the bearings and drive system remain consistent, and no added grease or oil is required that can attract contaminants that destroy conventional bearings.

The Global Self-Lubricating Sliding Bearings Market Size was estimated at USD 5403.64 million in 2023 and is projected to reach USD 7752.35 million by 2029, exhibiting a CAGR of 6.20% during the forecast period.
