Abstracts

Self-polishing coatings are advanced marine antifouling systems designed to continuously release biocides at a controlled rate through a hydrolytic or erosive mechanism, preventing the accumulation of marine organisms such as algae, barnacles, and tubeworms on ship hulls; these coatings consist of a polymer matrix that gradually wears away as the vessel moves through water, exposing fresh biocidal compounds while simultaneously maintaining a smooth surface that reduces drag, improves fuel efficiency, and minimizes the need for dry-docking and manual cleaning, thereby offering both economic and environmental benefits by cutting operational costs and limiting the spread of invasive species.

The global Self Polishing Coatings market size was estimated at USD 1980.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
