Abstracts

A self-priming gear pump is a positive displacement pump designed with two meshing gears that create a vacuum to draw fluid into the pump chamber without requiring external priming, making it capable of handling fluids with entrained gases or vapors and restarting after periods of dry operation. These pumps are characterized by their ability to evacuate air from the suction line and pump casing, enabling them to lift liquid from sources below the pump level, which distinguishes them from standard gear pumps that rely on a flooded suction. Common materials of construction include cast iron, stainless steel, or engineered plastics to accommodate various fluid compatibilities, and they are valued for their simplicity, reliability, and efficiency in transferring viscous or abrasive liquids such as fuels, oils, chemicals, and wastewater.

The global Self Priming Gear Pump market size was estimated at USD 850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
