Abstracts

A self-propelled treadmill is a type of fitness equipment that operates based on the user's own movement, where the belt is driven by the force exerted by the user's feet rather than an electric motor. This design eliminates the need for an external power source, relying instead on mechanical resistance systems such as magnetic, air, or friction-based mechanisms to create varying levels of intensity. Unlike motorized treadmills, which maintain a constant speed set by the user, self-propelled models require the individual to initiate and sustain the pace, resulting in a more natural running or walking motion that closely mimics outdoor activity. These treadmills are often favored for their simplicity, lower maintenance, energy efficiency, and ability to provide a workout that adapts intuitively to the user's effort, making them popular in settings where quiet operation, portability, and cost-effectiveness are prioritized.

The global Self Propelled Treadmill market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
