Abstracts

Self-recuperative burners recover heat from exhaust gas to preheat fresh air or fuel gas entering the burner, thereby significantly improving combustion efficiency and reducing energy consumption. Such burners are widely used in industrial heating systems, boilers, furnaces, and various processes that require precise temperature control and high efficiency. The core of the self-recuperative burner lies in its built-in heat exchange device, which can recover heat from the high-temperature exhaust gas and use it to preheat the intake air. This not only improves combustion efficiency, but also significantly reduces fuel consumption and achieves energy-saving goals.

The global Self-Recuperative Burners market size was estimated at USD 852.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
