Abstracts

Self-regenerative concrete, also known as self-healing concrete, is an advanced construction material engineered to autonomously repair its own cracks through biological or chemical mechanisms, typically by incorporating encapsulated healing agents such as bacteria (e.g., *Bacillus* species) that precipitate calcium carbonate or polymers that expand upon contact with water and air, thereby sealing fractures and restoring structural integrity without human intervention, which significantly extends the material's service life, reduces maintenance costs, and enhances durability in harsh environments. The global market for self-regenerative concrete is experiencing robust growth, driven by increasing infrastructure investments, rising demand for sustainable and resilient building materials, and stringent regulatory standards aimed at reducing carbon emissions and lifecycle costs in construction. Key market players are focusing on R&D to improve healing efficiency, scalability, and cost-effectiveness, with applications expanding across residential, commercial, industrial, and civil infrastructure sectors, particularly in regions prone to seismic activity or extreme weather conditions. North America and Europe currently lead in adoption due to advanced research initiatives and supportive government policies, while the Asia-Pacific region is emerging as a high-growth market, fueled by rapid urbanization and large-scale infrastructure projects in countries like China and India. Challenges include high initial costs compared to conventional concrete, limited long-term performance data, and the need for standardized testing protocols, but ongoing technological advancements and growing awareness of the long-term economic and environmental benefits are expected to propel market expansion.

The global Self Regenerative Concrete market size was estimated at USD 150.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.50% during the forecast period.
