Abstracts

The self-holding electric ball valve is a special valve device. The self-holding electric ball valve is mainly composed of two parts: the valve body and the drive mechanism. The valve body is the outer shell of the ball valve, and a channel is designed inside for fluid flow. The drive mechanism is responsible for receiving the control signal and driving the ball valve core to rotate. After receiving the open (close) valve signal, the drive mechanism of the self-holding electric ball valve is energized and drives the ball valve core to rotate. Every time the valve core rotates 90°, the function of the valve will switch once. When the valve core is in place, the internal power of the drive mechanism will be automatically cut off, and the valve position mechanical indicator will point to the corresponding valve position, and the valve position switch will also output a passive valve position signal.

The global Self Retaining Electric Ball Valve market size was estimated at USD 699.46 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
