Abstracts

Self supervised learning (SSL) is a machine learning paradigm in which models learn meaningful representations from unlabeled data by solving pretext tasks that are automatically generated from the data itself, such as predicting masked parts of an input, reconstructing corrupted data, or contrasting different augmented views of the same sample, thereby eliminating or drastically reducing the need for manually annotated datasets while still enabling the model to capture underlying structures and features that can be transferred to downstream tasks through fine-tuning.

The global Self Supervised Learning market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
