Report Overview:

Self-watering planters refer to containers specifically engineered for plants that draw water automatically from beneath the soil surface through capillary action into the root zone as needed, thereby eliminating the need for manually watering frequently. Instead of relying entirely on external irrigation sources like conventional flowerpots, self-watering models integrate built-in reservoirs filled via separate ports ensuring adequate moisture content remains available whenever plant roots encounter dry soil conditions. This system allows for optimal hydration while minimizing excessive water uptakes harmful to foliage health.
