Abstracts

Semi-active air suspension is a type of vehicle suspension system that combines the benefits of both passive and active suspension systems. It uses air springs (or airbags) to support the vehicle's weight and provide a cushioning effect, while also incorporating adjustable dampers that can change their damping characteristics in real-time based on driving conditions. This allows for improved ride comfort and handling compared to traditional passive suspensions, without the high energy consumption of fully active systems.

The global Semi-active Air Suspension market size was estimated at USD 1583.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.70% during the forecast period.
