## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Semi Aromatic Nylon competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Semi aromatic nylon is produced by condensation of aliphatic diamines or diacids with aromatic cyclic diacids or diamines. Semi aromatic nylon, due to its molecular backbone containing both aromatic rings and fatty chains, combines the excellent properties of aromatic nylon with the good formability of fatty nylon. It generally has the advantages of high temperature resistance, corrosion resistance, and low water absorption. In recent years, it has been widely used in fields such as electronics, automotive industry, and equipment manufacturing. Semi aromatic nylon can be divided into homopolymer semi aromatic nylon and copolymer semi aromatic nylon according to resin type. The composition of homopolymer semi aromatic nylon is determined, and it generally has high crystallinity, making it particularly suitable for fiber manufacturing. In 2024, global Semi Aromatic Nylon production reached approximately 160 K MT, with an average global market price of around US\$ 9000 per Ton. Semi aromatic nylon combines the advantages of both aliphatic and fully aromatic nylon, with smoother molecular chains and higher crystallinity compared to fully aromatic nylon. It also has a higher melting point compared to aliphatic nylon and excellent overall performance. Currently, most commercially available high-temperature nylon is semi aromatic nylon, such as PA4T, PA6T, PA9T, PA10T, PAMXD6, etc.

The global Semi Aromatic Nylon market size was estimated at USD 1438.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
