## Abstracts

The semi-automatic hammer cyclone mill is a pulverizing equipment that combines hammer crushing and cyclone separation technology. It achieves efficient crushing by using a high-speed rotating hammer to strongly impact and shear the material. At the same time, the cyclone separation in the grinding chamber effectively separates fine powder from coarse particles to ensure uniform particle size of the ground material. The working principle of the semi-automatic hammer cyclone mill is mainly based on the high-speed rotating hammer to strongly impact and shear the material. When the material enters the grinding chamber, it is quickly crushed into fine particles by the impact and shearing of the high-speed rotating hammer. At the same time, the cyclone separator in the grinding chamber separates the fine powder produced by grinding from the coarse particles to ensure uniform particle size.

The global Semi-automatic Hammer Cyclone Mill market size was estimated at USD 734.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
