Abstracts

Semi-chemical wood pulp refers to a type of mechanical-thermal-chemical pulp produced through a two-step process where wood chips are first partially softened using chemicals?typically sodium sulfite, carbonate, or hydroxide?followed by mechanical refining to separate the fibers. This method yields pulp with properties intermediate between fully chemical (e.g., kraft or sulfite) and purely mechanical pulps, offering a balance of strength, yield, and economics; it is characterized by higher yield than chemical pulps (typically 65?85%) while providing better strength and brightness than stone groundwood or thermomechanical pulp. Primarily derived from hardwoods like oak, birch, or eucalyptus, semi-chemical pulp is predominantly used in the production of corrugating medium for packaging materials, as well as in certain specialty papers and board grades where a combination of stiffness, compression resistance, and cost-effectiveness is required.

The global Semi Chemical Wood Pulp market size was estimated at USD 17632.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
