Abstracts

Semi-chemical wood pulp is a type of pulp produced through a two-step process involving mild chemical treatment?typically using sodium sulfite or sodium carbonate?followed by mechanical refining, resulting in fibers that are stronger and more resilient than those from purely mechanical pulping methods but less refined than fully chemical pulps. This intermediate category offers a balance of cost efficiency and performance, making it particularly suitable for packaging materials such as corrugated medium, cardboard, and other industrial papers where strength and rigidity are prioritized over brightness or smoothness. The semi-chemical process yields a higher pulp output compared to chemical pulping methods, as it retains more of the original wood components, contributing to its economic appeal in specific applications within the pulp and paper industry.

The global Semi Chemical Wood Pulps market size was estimated at USD 1850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.80% during the forecast period.
