## Abstracts

Semi-conducting crepe paper is a specialized electrical insulation material engineered with controlled resistivity, typically composed of cellulose fibers impregnated with carbon black or other conductive particles to provide semi-conductive properties. It is primarily used in medium and high-voltage power cables, transformers, and electrical machinery to smooth electrical stress distribution, prevent partial discharges, and ensure uniform electric field gradients in insulation systems. The creped structure enhances its conformability, allowing it to wrap tightly around conductive components like cable conductors or shields while maintaining flexibility, thermal stability, and compatibility with other insulating materials such as cross-linked polyethylene (XLPE) or oil-impregnated paper in demanding electrical applications.

The global Semi Conducting Crepe Paper market size was estimated at USD 785.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
