Abstracts

Semi-intensive green roofs are a type of vegetated roofing system that combines elements of both extensive and intensive designs, typically featuring a growing medium depth of 6 to 12 inches (15?30 cm), which supports a wider variety of plant species than extensive systems?including perennials, grasses, shrubs, and small trees?while requiring more maintenance, irrigation, and structural support than extensive roofs but less than fully intensive green roofs. These systems are engineered to provide enhanced ecological benefits, such as improved stormwater management, biodiversity promotion, urban heat island mitigation, and aesthetic value, making them suitable for commercial, institutional, and multi-family residential buildings where both environmental performance and usability are prioritized.
